5 days ago

“ Should we be breeding dogs with pinched nasal cavities ”

5 days ago

**A large number of individuals  
in a breed population provides  
greater choices when making  
breeding decisions**

With each selected trait or disorder, the  
**SELECTION** proportion of the available gene pool decreases

## My last mating was an (I prefer to do)

Total Results: 25

# *Types of Matings*

- ♦ Inbreeding: Breeding closely related dogs.
- ♦ Linebreeding: Less intense form of inbreeding. Concentrating the genes of a particular ancestor.
- ♦ Outbreeding: Breeding dogs less related than the average of the population.
- ♦ Crossbreeding: Breeding two different breeds together.

***Pure-bred***

***Designer breed***

***Random-bred***

# Get Fuzzy By Darby Conley

©1990 Darby Conley, Dist. by UFS, Inc. WWW.COMICS

# *Inbreeding Coefficient*

*(Wright's Coefficient =  $F_x$ )*

- ◆ The proportion of all variable gene pairs that are likely to be homozygous due to inheritance from ancestors *common* to the sire and dam.
- ◆ The probability of an individual being homozygous at a given gene pair for a gene received from an ancestor *common* to the sire and dam.

# *Relationship Coefficient*

- ◆ A measurement of the probable genetic likeness between the individual and a particular ancestor
- ◆ The probable percentage of genes the individual and the ancestor have in common from descent
- ◆ Can be approximated by % blood calculation

 **Poll locked.** Responses not accepted.

**Are absolute levels of breed homozygosity and differences in homozygosity between individual dogs important?**

 **Poll locked.** Responses not accepted.

## Why?

“ Potential for detrimental recessives ”

“ In the wrong hands it could be detrimental in regards to the health of the offspring ”

“ In order to get consistent breeding, one needs to understand how a dog will produce itself ”

## Why?

“ if the heritable traits are identified by homozygosity that would be informative ”

“ Disease ”

“ It gives us probability of disease ”

“ For predictability of genetic traits ”

“ Heterozygosity confers fitness/vigor ”

## Why?

“ To ensure undesirable traits aren't passed on ”

“ Fbdca ”

“ Might show consistency in what is produced ”

“ Unpreferable genes ”

**In order to understand about  
breeds, you must understand  
about breed evolution**

**The development of breeds  
occurred through artificial selection  
for body type, color, coat type,  
behavior, and conformational  
aspects**

**As breed lines became more  
specialized and stud books  
closed, those who did not  
conform to the standard were  
removed from breeding**

# Studies of dog breeds estimate that they lose on average 35% of their genetic diversity through breed formation

(Gray MM et. al. Genetics 2009; 181:1493-505)

# Pedigree Analysis of Populations

## A typical breed pedigree

# Any selection over generations will create

- ◆ **Homozygosity – uniform purposeful selection for breeding goals**
- ◆ **Diminished frequencies of undesirable genes**

*Any selection will cause a loss of  
genetic diversity*

**This loss is not detrimental to the  
population, if it is directly related  
to increasing its superiority**

Breed-defining genes would be expected to become homozygous due to selection over time

These include breed-selected traits for size, coat color & texture, behavior, skeletal morphology, and other traits

**Even without close linebreeding,  
selection for positive traits will  
increase their homozygosity having  
originated from distant ancestors**

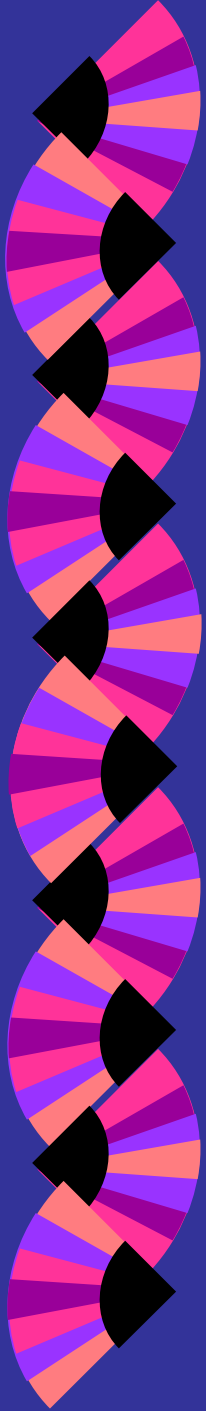

*SELECTION*

=

# *Modern Breed Population Statistics*

- 
- ◆ High deep pedigree average inbreeding coefficients (homozygosity)
  - ◆ Low effective population size (limited number of founders)
  - ◆ High average relationship coefficients to influential ancestors
  - ◆ These ancestors appear in the pedigrees of every member of the breed, with genetic contributions of 15% 35%

***These are necessary and  
expected consequences of  
breed formation and evolution***

***Homozygosity is not inherently correlated to impaired genetic health, nor does it need to be artificially controlled***

# *Healthy Breed Genes Pools Require Expanding, or Large Stable Populations*

- ◆ Allows the creation of new “family lines”
- ◆ Allows for within-breed diversity
- ◆ Population contraction causes loss of breed diversity and quality breed lines

Selection of breeding animals should represent the quality traits and breadth of pedigree background

Quality lines should not be abandoned

# *The Popular Sire Syndrome*

*The popular sire syndrome is the single most influential factor in restricting breed gene pool diversity*

- ♦ The overuse of a popular sire;
  - ♦ Quickly disseminates his genes throughout the gene pool without the benefit of evaluation over time
  - ♦ Causes the loss of other quality male lines that should be contributing to the gene pool

## *A popular sire's influence is different from that of an influential ancestor*

- ♦ An influential ancestor's contribution is continually evaluated through its descendants, who have to compete with others for breeding status
- ♦ If a popular sire is found to pass on deleterious genes, the resultant purging process also causes the loss of influence of the quality dam lines to which he was bred

# Diseases and Disorders

## The Dark Side of Breed Development

# ***All individuals carry some deleterious mutations***

- ◆ Quality individuals who propagate will also propagate their deleterious mutations
- ◆ These can cause breed-related disease if they are disseminated and increase in frequency through the founder's effect

*Breed propagation must  
always include active  
monitoring **and** selection  
against genetic disease*

**Without this selection, the  
genetic health of the breed  
will decline**

*The genetic health of dog breeds  
is not a direct function of  
homozygosity or heterozygosity,  
but of the accumulation of specific  
disease liability genes*

# *Breed Maintenance*

*In response to perceived concerns with genetic diversity, some advocate for homozygosity testing and SSP-type outbreeding programs*

Recommendations to only outbreed  
(breed to those least related)  
homogenizes breeds and erases the  
genetic difference between individuals

**UCDAVIS**  
VETERINARY MEDICINE

VETERINARY GENETICS LABORATORY

A decorative graphic on the left side of the slide, resembling a DNA double helix. It consists of two intertwined strands, one colored in shades of pink and the other in shades of purple. The strands are connected by black semi-circular bases, creating a spiral pattern that runs vertically down the left edge of the slide.

None of the types of mating  
systems (Inbreeding,  
Linebreeding, Outbreeding)  
change the frequency of defective  
genes, or their dissemination

## *Outbreeding will not change the frequency of deleterious genes*

- ♦ For dispersed breed-related deleterious genes, outbreeding will not reduce the frequency of affected individuals
- ♦ Affected individuals will be produced in a random fashion

# Genetic Diversity

- ♦ Molecular geneticists have discovered the tools to identify homozygosity within breeds
- ♦ In identifying these tools, molecular geneticists are instructing breeders to use these tools as goals of breeding and only outbreed to unrelated dogs and increase their “genetic diversity”

# Genetic Diversity

- ♦ All breeds are inbred with many different parameters causing changes in their homozygosity and genetic diversity
- ♦ None of the manipulations recommended by molecular geneticist have to do with:
  - ♦ The health of the breeds
  - ♦ Selection for or against specific health or diseases or liability genes

# ***Selection for Heterozygosity***

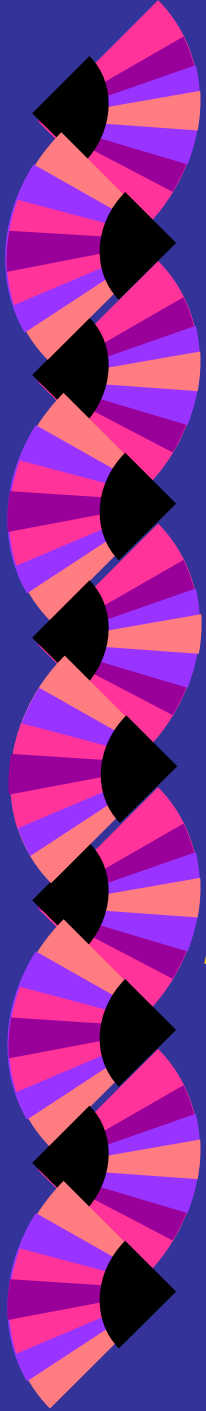

- ◆ **Selects against** good homozygosity accomplished through generations of selection
- ◆ **Blindly increases** minor frequency genes and chromosomal segments
- ◆ **These are likely** minor frequency due to selection over generations against undesirable and deleterious traits

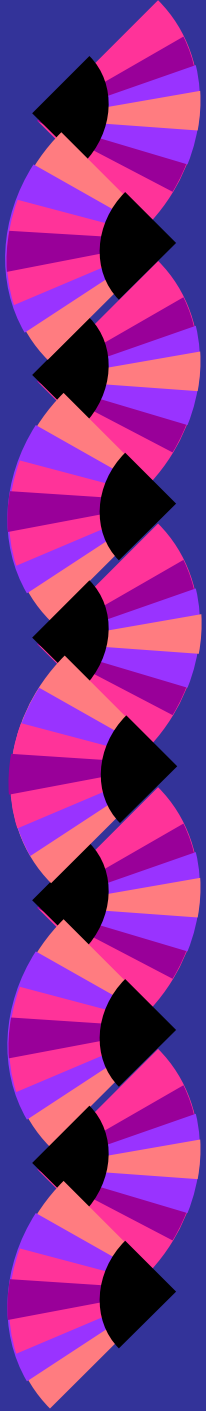

Genetic Diversity  
=

*It is the varied opinion of  
breeders as to what  
constitutes the ideal animal,  
and their selection of  
breeding stock that maintains  
breed diversity*

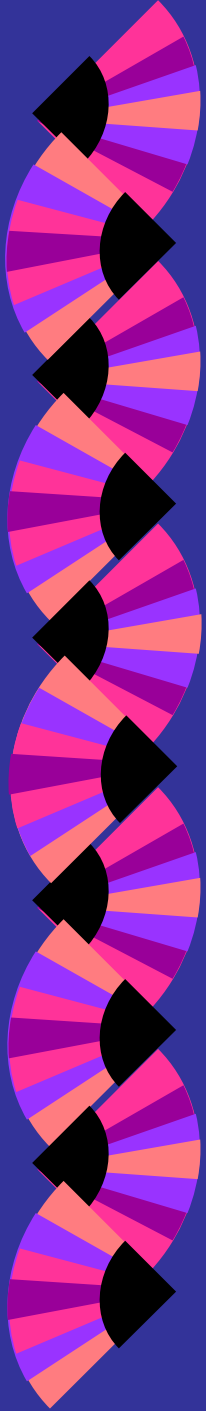

*When breeds have issues with genetic disease, the only way to improve their gene pool is through genetic screening and selection against the specific diseases and their associated liability genes*

Moderation away from  
extremes that cause disease  
should be a guiding principle in  
breeding and judging

Pre-breeding Health Screening  
should become as  
universal as  
Equine Pre-purchase Exams

# *Breed Maintenance Requires;*

- 1) Avoiding the popular sire syndrome.
- 2) Utilizing quality dogs from the breadth of your population to expand the gene pool.
- 3) Monitoring genetic health issues through regular health surveys.
- 4) Doing genetic screening for breed-related disorders.
- 5) Participating in open health registries to manage genetic disorders.
- 6) Constant selection for quality and health
